minutes later the two women were quietly walking home with the baby, who appeared to be dead.

While the mother goes about her normal tasks, with the child tied on her back all the time, the father stays in the hammock, absolutely motionless, eating nothing but fruit and palm-hearts—'they don't heat the blood,' Luis Antonio assured us.

Among the Guiana-Amazon Indians I have never heard of the father himself suffering from birth-pangs during this period of rest. Such reports, however, have come from travellers and observers of the Indian tribes inhabiting the southern regions of the lower Amazon. Before one can believe them one must accept a little more than the theory of the inter-relation of cause and effect. A good dose of barefaced auto-suggestion would also be needed to account for this phenomenon, and only the most undeveloped of the Indians would be capable of it.

IV

Of kindred interest, while we are on the subject of childbirth, is the organization of Indian society. It has been asked whether the pattern is patriarchal or matriarchal, and what part is played by the individual family.

If the question is limited to the Shirians, the answer is simple: they have reached no stage of organization above the rudimentary animal level. The family has the sole function of producing life and protecting it until the offspring is capable of fending for itself. Their society is not patriarchal, because the role of the family ceases where its physical functions cease, at the point where, in civilized societies, moral functions begin. Nor is the pattern matriarchal, because the women are held in a form of slavery, though the very lack of an exact social system means that they sometimes emerge from this to become the companions of the men—a state of affairs which may be regarded as more emancipated, or less.

The children of both sexes, while they are young, remain the exclusive responsibility of the women, but when the boys reach an age at which they can do without their mothers (this generally means as soon as they cease to be breast-fed) they become independent males and do not belong to anybody in particular. Up to a certain point the father is free to pick out one who may be

especially strong and intelligent, and keep him at his side, adopting him, as it were, as his successor. The little girls continue to live in the feminine world of their tribe. Shy and submissive, they take on the humblest tasks, fetching water, making the fire and helping in the preparation—highly problematical—of food.

Such definitions of customs have, however, only a relative value, like any attempt to estimate the Shirian way of life: for Shirians are to be found spread over wild territory of vast extent. Their customs are less well defined than one might suppose after reading certain tracts about primitive peoples—the Pacific islanders, for instance. These give the impression that with slight formal changes only, Western culture might have much to learn from the degree of social organization they have attained to. The Shirian tribes, cut off from one another as they are by physical barriers such as mountains and rivers, and moral barriers like the ceaseless state of war which exists between the various branches of this race of 'howling Indians', have developed their own customs in their own sporadic fashion. Sometimes they have been weakened by contact with foreigners, such as the Makiritari in the north-west and the Makushi in the east. More often they have been weakened by a lack of strong traditions, which do not spring easily from such an excessively low level of culture, where mere survival calls for an unending struggle against the tremendous power of the eternally hostile forest.

The most primitive races are those most affected by their geographical setting. Their environment conditions them. Only by adapting themselves continually to their surroundings, only by the long process of response to the determining factor of geography, can they create that growing racial identity which at last succeeds in reversing the process—that is, in conditioning the surroundings instead of being conditioned by them. But we are here touching on the larger question of the development of civilization generally.

Where the Shirians are concerned, we are still at the beginning of the beginning, when geography is the absolute determining factor. Here environment is the master of man—a creature inferior, qualitatively and quantitatively, to the region which it is his fate to inhabit.

The territory they occupy is immense. Divided though it may be by great cordilleras, which make it the breeding ground for various rivers rushing north, west and south, it possesses one marked characteristic throughout its whole extent: the sources and the headwaters of the rivers are contained in a sort of
